

# SOLVING (CERTAIN) RECURRENCES

CH9.2

Based on this, can we know what  $a_2$  is?

$$a_n = -4a_{n-1} - 3a_{n-2}$$

no, not enough info.

we need base cases

$$a_0 = 0$$

$$a_1 = 1$$

based on this  $a_2 = -4(1) - 3(0) = -4$ 

WE are looking for a technique to solve recurrences of the form  $a_n = c_1 a_{n-1} + c_2 a_{n-2}$

↳ CAN EXTEND TO MORE GENERAL CASES TOO

CAN WE COME UP W/ A CLOSED FORM SOLUTION TO THIS RECURRENCE?

We want a solution in the form  $a_n = r^n$  for some value  $r$ .

(NOT GENERAL, BUT WE WILL CONSTRUCT A GENERAL SOLUTION)

$$r^n = -4(r^{n-1}) - 3(r^{n-2}) \leftarrow \text{subbing in proposed solution for } a_n$$

$$r^n + 4r^{n-1} + 3r^{n-2} = 0 \leftarrow \text{move all to left side}$$

$$r^2 + 4r + 3 = 0 \leftarrow \text{divide by } r^{n-2}$$

$$(r+1)(r+3) = 0 \leftarrow \text{roots } = -1, -3$$

so what happens when we plug in  $a_n = r^n$ 

$$a_n = (-1)^n$$

$$a_n = (-3)^n$$

$n$	0	1	2	3	4	5
$(-1)^n$	1	-1	1	-1	1	-1

we sub this into the original recurrence.  
IF IT ALL WORKS, THEN THIS IS A SOLUTION

↳ SO THIS SEQUENCE IS A

SOLUTION TO OUR ORIGINAL RECURRENCE

$n$	0	1	2	3
$(-3)^n$	1	-3	9	-27

$-4(-3) - 3(1) = 9 \checkmark$

THINK ABOUT IT BACKWARDS:

SUPPOSE  $(r+1)(r+3) = 0$  IS TRUEgo from  $n-2$  up.

$$\rightarrow \text{if } (r+1)(r+3) = 0, \text{ then } r^n = -4r^{n-1} - 3r^{n-2}$$

THIS IS EXACTLY THE CONDITION NEEDED TO SATISFY THE ORIGINAL RECURRENCE

## NOW WE WANT MORE SOLUTIONS

$(-1)^n$	1	-1	1	-1	1	-1
$\times 3$	3	-3	3	-3	3	-3

multiply all by 3

does it still satisfy the recurrence?

$$\hookrightarrow \text{becomes } 3(a_n) = -4(3a_{n-1}) - 3(3a_{n-2}) = \text{same thing}$$

so we can multiply any value of the sequence by a  $C \in \mathbb{R}$  + it would still satisfy the recurrence=  $\infty$  MANY SOLUTIONS BUT WAIT THERE'S MORE!

$(-1)^n$	1	-1	1	-1	1	-1
$(-3)^n$	1	-3	9	-27		
$\times 2$	2	-4	10	-28		

add together

$$-4(10) - 3(-4) = -28 \checkmark$$

THIS ALSO SATISFIES THE RECURRENCE

$a_1 (-1)^n$   
 $a_2 (-3)^n$   
 $a_1 (-1)^n + a_2 (-3)^n$

ALL SATISFY THE RECURRENCE FOR ANY  $a_1, a_2 \in \mathbb{R}$

GENERAL FORM TO SOLUTIONS OF RECURRENCE

NOW... CAN WE FIND A CLOSED FORM SOLUTION SPECIFIC TO THESE INITIAL CONDITIONS?

$$\begin{cases} a_0 = 0 & a_1 = 1 \\ \text{based on this } a_2 = -4 * 1 - 3 * 0 = -4 \end{cases}$$

START w/ the general form of solutions:

$$a_n = \alpha_1 (-1)^n + \alpha_2 (-3)^n \quad \forall \alpha_1, \alpha_2 \in \mathbb{R}$$

Plug in initial conditions:  $n = 0$  +  $n = 1$

$$\begin{aligned} a_n &= \alpha_1 (-1)^0 + \alpha_2 (-3)^0 \xrightarrow{\text{SIMPLIFY}} 0 = \alpha_1 + \alpha_2 \\ a_n &= \alpha_1 (-1)^1 + \alpha_2 (-3)^1 \rightarrow 1 = \alpha_1 (-1) + \alpha_2 (-3) \end{aligned} \quad \left. \begin{array}{l} \\ \end{array} \right\} \begin{array}{l} \text{2 equations w/} \\ \text{2 unknowns} \end{array}$$

Solve for  $\alpha_1$  +  $\alpha_2$ :

add them!

$$\begin{aligned} 0 &= \alpha_1 + \alpha_2 \\ + \quad 1 &= \alpha_1 (-1) + \alpha_2 (-3) \\ \hline 1 &= -2\alpha_2 \\ \alpha_2 &= -\frac{1}{2} & \alpha_1 &= \frac{1}{2} \end{aligned}$$

Substitute into general solution:

$$a_n = \frac{1}{2} (-1)^n - \frac{1}{2} (-3)^n$$

Plug in to check

NOTE: THIS DEMONSTRATES THAT WE CAN SOLVE FOR

OTHER  $\alpha_1$  +  $\alpha_2$ 'S TO SATISFY OTHER

INITIAL CONDITIONS

## RECAP OF PROCESS

WE WANT TO SOLVE A RECURRENCE OF THE FORM:

$$a_n = C_1 a_{n-1} + C_2 a_{n-2}$$

① FIND CHARACTERISTIC EQUATION

$$r^2 - C_1 r - C_2 = 0 \quad \leftarrow \text{ALWAYS THE CHARACTERISTIC EQUATION}$$

② FIND THE ROOTS ( $r_1, r_2$ ) OF THE CE

↳ FACTOR / QUADRATIC FORMULA

③ WRITE GENERAL FORM OF THE SOLUTION

$$a_n = A_1 r_1^n + A_2 r_2^n \quad \text{for } \forall n, A_1, A_2 \in \mathbb{R}$$

④ SUBSTITUTE THE INITIAL CONDITIONS INTO THE GENERAL FORM TO GET A SYSTEM OF 2 EQUATIONS W/ 2 UNKNOWN

⑤ SOLVE FOR  $\alpha_1$  +  $\alpha_2$

⑥ SUBSTITUTE THOSE INTO THE GENERAL FORM SOLUTION

$(r_1)^n$  is a solution to the recurrence  
(maybe the wrong solution, but one of them)

Multiply it by whatever, and you still have a solution.  
(Call  $\alpha_1$  the value we multiply  $(r_1)^n$  by)
