

BINARY TREES CONTINUED

THE HEIGHT OF A ROOTED TREE = 4

THE LONGEST PATH (HIGHEST LEVEL)

THE LEVEL OF A VERTEX IN A ROOTED TREE:

OF EDGES IN THE DIRECTED PATH FROM THE ROOT

LEVEL OF G: 3

LEVEL OF C: 2

LEVEL 0: ROOT

LEVEL 3 → E, F, G, H

LEVEL 2: C, D

LEVEL 1: A, B

BINARY TREE & RECURSIVE DEFINITIONS

° A single vertex is a full binary tree

° If $T_1 + T_2$ are full bin. trees, then $T_1 + T_2$ is a full bin. tree

FORMED BY A NEW VERTEX, THE ROOT OF THE NEW TREE, WHICH HAS EDGES TO THE ROOTS OF $T_1 + T_2$

WE WANT A RECURSIVE DEF. OF THE HEIGHT OF THE TREE:
IF T IS A SINGLE VERTEX, then $h(T) = 0$
RECURSIVE: IF $T = T_1 + T_2$ for a f.b.t. $T_1 + T_2$,
 $h(T) = \max(h(T_1), h(T_2)) + 1$

BOUND THE # OF VERTICES IN THE TREE BASED ON ITS HEIGHT

° IF THE HEIGHT OF A FULL BIN. TREE IS h ,

then there is at most $2^{h+1} - 1$ vertices and at least $h+1$ vertices

↑ NOT A TIGHT BOUND

LET'S PROVE IT

EVERY f.b.t. has at most $2^{h+1} - 1$ vertices where h is the height

BASIS:

IF T IS A SINGLE VERTEX, $V(T) = 1 \rightarrow h(T) = 0$

PLUG: $2^{0+1} - 1 = 1$, $V(T) = 1$ ✓

INDUCTIVE STEP:

IF T IS $T_1 + T_2$ for f.b.t. $T_1 + T_2$,

assume $V(T_1) \leq 2^{h(T_1)+1} - 1$ and $V(T_2) \leq 2^{h(T_2)+1} - 1$ → assume true for all component trees, show this property holds for all binary trees

we need to prove: $V(T) \leq 2^{h(T)+1} - 1$

$$V(T_1 + T_2) = V(T_1) + V(T_2) + 1$$

$$\leq (2^{h(T_1)+1} - 1) + (2^{h(T_2)+1} - 1) + 1$$

$$\leq (2^{h(T_1)+1} + 2^{h(T_2)+1}) - 1$$

$$\leq (2^{\max(h(T_1), h(T_2))+1}) + (2^{\max(h(T_1), h(T_2))+1}) - 1$$

$$\leq 2^{h(T_1 + T_2) + 1} - 1$$

$$\leq 2^{h(T_1 + T_2) + 1} - 1$$

$$\leq 2^{(h(T_1 + T_2) + 1)} - 1$$

$$\text{QOAL: } V(T) \leq 2^{h(T)+1} - 1 \quad \checkmark$$

MAX ≠ LEAST BECAUSE

FULL BINARY TREES w/ HEIGHT 4

HEIGHT WON'T TELL YOU # OF NODES

STRINGS ~ RECURSIVE DEF.S

CH 5.3

GIVEN AN ALPHABET Σ ,

WE DEFINE THE SET OF STRINGS OVER THE ALPHABET

- BASIS:** λ is a string (this is the empty string)
- RECURSIVE STEP:** if w is a string + $x \in \Sigma$, then wx is a string.
like putting string in another symbol together to make a new string.
Ex: if $w = 0110$, $x = 1$, $wx = 01101$

NOW WE WANT A FUNCTION FOR THE LENGTH OF THE STRING

$$\text{length}(\lambda) = 0$$

$$\text{length}(wx), \text{ where } w \text{ is a string } \wedge x \in \Sigma, = \text{length}(w) + 1$$

↳ all the symbols from w + 1 from x

STRUCTURAL INDUCTION

CLAIM: FOR ALL STRINGS w , $\lambda w = w$ PROOF: BASIS - $\lambda \cdot \lambda = \lambda$, by def. of concatenationINDUCTIVE - ASSUME $\lambda \cdot w = w$, show $\lambda \cdot wx = wx$ where $x \in \Sigma$

WE WANT TO PROVE THIS CLAIM FOR ALL STRINGS

ASSUME OUR CLAIM IS TRUE FOR THE COMPONENT STRING

$$\underbrace{[a b c d e d s]}_w \underbrace{a}_x$$

$$\lambda \cdot wx = (\lambda \cdot w) x \quad \text{def. of concatenation}$$

$$= wx \quad \text{by IH (ASSUME } \lambda \cdot w = w)$$

$$\text{SO } \lambda \cdot wx = wx$$

DEFINE CONCATENATION:

 $w_1 \cdot w_2$ is the concatenation of w_1 + w_2

$$w \cdot \lambda = w$$

$$\text{RECURSIVE: } w_1 \cdot w_2 x = (w_1 \cdot w_2) x \rightarrow \begin{array}{l} 1100 \cdot 1001 \\ (1100 \cdot 100)1 \\ ((1100 \cdot 10)0)1 \\ (((1100 \cdot 1)0)0)1 \\ (((((1100 \cdot \lambda)1)0)0)0)1 \\ \uparrow \\ \text{REDUCE TILL } w_2 = \lambda \end{array} \quad \begin{array}{l} \text{RECONSTRUCT INTO} \\ 11001001 \end{array}$$

DEFINE REVERSAL:

$$\text{REVERSE}(\lambda) = \lambda$$

$$\text{REVERSE}(CABC) = CBA$$

$$\text{RECURSIVE: REVERSE}(WX) = \lambda \cdot x \cdot \text{REVERSE}(W)$$

$$\begin{array}{l} \text{REV}(abc) = c \cdot \text{REV}(ab) \\ c \cdot b \cdot \text{REV}(a) \\ c \cdot b \cdot a \cdot \text{REV}(\lambda) \\ c \cdot b \cdot a \cdot \lambda = c \cdot (cb \cdot \lambda) a \dots \rightarrow cba \end{array}$$

↳ λ BECAUSE x BY ITSELF IS NOT A STRING, BY CONCATENATING λ W/ x IT MAKES IT A STRING!

BASE ON STRINGS OF LENGTH k ,

PROVE IT WORKS FOR THE NEXT LENGTH UP
